

# Exposure Assessment and Controls to Reduce Nanoparticle Exposure

Dr. Candace SJ Tsai

November 9, 2011  
TURI CE Workshop

---

---

---

---

---

---

---

---

How are we exposed?  
How serious the exposure can be?

How do we be exposed?  
Airborne or Liquid?

2

---

---

---

---

---

---

---

---

## How do we measure exposure?

3

---

---

---

---

---

---

---

---

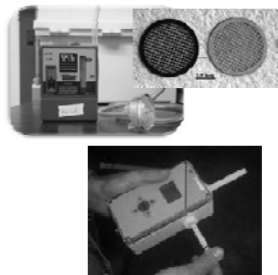

**Measure airborne nanoparticle concentration**

TSI Aerodynamic Particle Sizer Spectrometer (APS)

TSI Fast Mobility Particle Spectrometer (FMPS)

**Collect airborne nanoparticles**

4

---

---

---

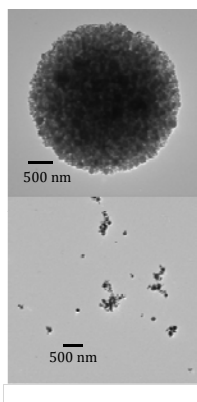

---

---

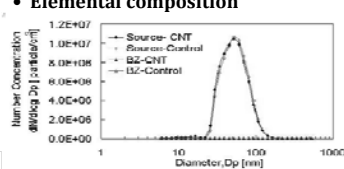

---

---

---

- Mass concentration
- Surface area concentration
- Number concentration
- Particle size distribution
- Total particle number concentration
- Morphology
- Elemental composition

---

---

---

---

---

---

---

---

**Exposure Assessment**

1. Identify Potential Exposure and Screening 
2. Examine Background Issues 
3. Monitoring & Collect Particles 
4. Characterize Particles 
5. Evaluation & Further action - Control Strategies

---

---

---

---

---

---

---

---

---

---

---

---

---

---

**How can we avoid exposure?**

---

---

---

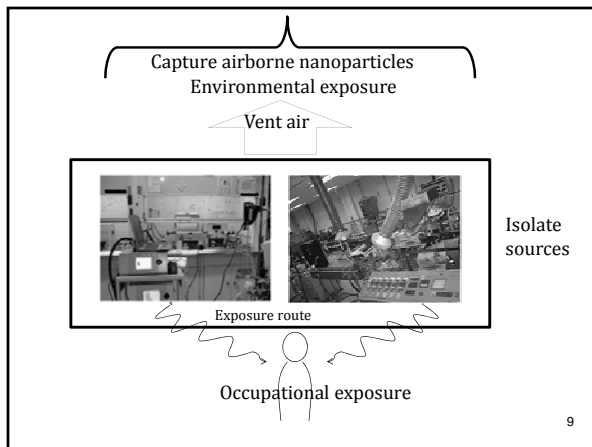

---

---

---

---

---

---

---

---

---

---

---

---

---

### Hierarchy of Control Methods

- Engineering controls
  - Substitution
  - Isolation
  - Filtration
  - Ventilation
    - General exhaust ventilation
    - Local exhaust ventilation
- Administrative controls
  - Worker training
  - Medical monitoring
  - Scheduling

10

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

### Key Elements to Control Exposure

- Airborne nanoparticles behave very much like gas molecules.
- Ventilation and isolation control methods developed for gases should work well to protect workers from exposure to nanoparticles.
- Air flow pattern plays an important role.
- Agglomerate or not?

11/7/2011

13

---

---

---

---

---

---

---

---

### Airborne Nanoparticles

Agglomeration

---

---

---

---

---

---

---

---

How does the local exhaust ventilation work?

15

---

---

---

---

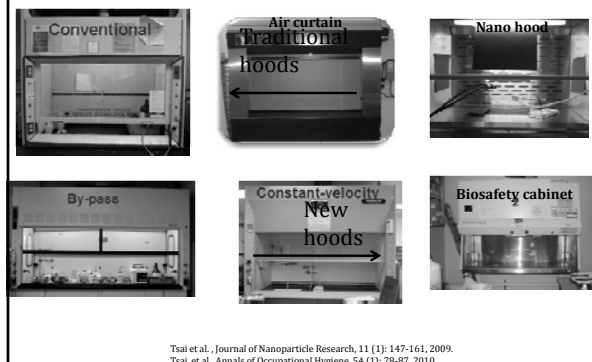

---

---

---

---

### Ventilation Systems

---

---

---

---

---

---

---

---

### Why Is Important?

- Hoods did not provide "zero" leakage.
- The ASHRAE 110 (ASHRAE/ANSI, 1995) acceptance criterion for hood performance is a breathing zone SF<sub>6</sub> concentration of 0.1 ppm (2 x 10<sup>9</sup> molecules/cm<sup>3</sup>).
- Tested in the close to ideal environment, practical use does not have same conditions.
- Seek the optimal condition/hood for NPs handling.

---

---

---

---

---

---

---

---

### Examine Airflow Pattern

---

---

---

---

---

---

---

---

19

---

---

---

---

---

---

---

---

20

---

---

---

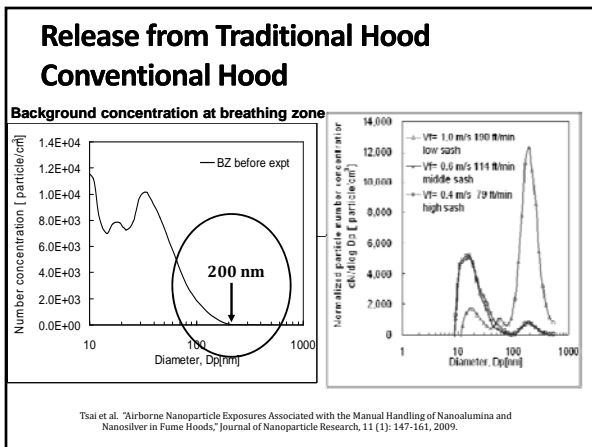

---

---

---

---

---

---

---

---

---

---

---

---

### Air Curtain Hood

27

---

---

---

---

---

---

---

---

### Summary

- Newly designed hoods for nanopowders are comparable to biosafety cabinet and air curtain hood.
- Turbulence and wake can be reduced, but not eliminated, for hoods with airflow across the hood opening.
- Optimal face velocity varies by the hood design.
- Must use hoods with high caution and good training concerning **worker's motion**.
- Suction force at the doorsill downward exhaust plays an important role to remove escaping nanoparticles.

28

---

---

---

---

---

---

---

---

### Occupational and laboratory exposure from manufacturing

29

---

---

---

---

---

---

---

---

### Manufacture Nanocomposites

---

---

---

---

---

---

---

**NIOSH** 

- NIOSH hosted a medical surveillance workshop in 2010, not specific guidance is defined. Current approach is to implement engineering controls to reduce and prevent exposure happened to workers while we are developing medical surveillance method, we may get a negative result in the future if our controls are well developed and implemented.

---

---

---

---

---

---

**US OSHA**

- OSHA current nanotechnology standard:  
Expand the coverage of existing standards to nanomaterials (construction materials)
- Section 5(a)(1) of the Occupational Safety and Health Act of 1970 (29 U.S.C. 654), often referred to as **the General Duty Clause**, requires employers to "furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to his employees." Section 5(a)(2) requires employers to "comply with occupational safety and health standards" promulgated under this Act.

OSHA Nanotechnology standard website  
[http://www.osha.gov/dsg/nanotechnology/nanotech\\_standards.html](http://www.osha.gov/dsg/nanotechnology/nanotech_standards.html)

---

---

---

---

---

---

---

**Concerns over the Use of ENPs**

Blogsphere trends

"If you increase the magnification another million times you can see the safety regulations." 5

---

---

---

---

---

---

---

---

**Recent Regulatory Activity in the United States, CA**

Mandatory requirements

- The state of CA require manufacturers to submit information.
- Call-in materials:
- 2009 CNT
  - 2010 TiO<sub>2</sub>, Silver, CeO<sub>2</sub>, Nano Zero Valent Iron (NZVI), ZnO, QD
- Require information about analytical result, environment fate and transport, worker safety, etc.
